PROJECT DEVELOPMENT PHASE

SPRINT-II

Date	02 November 2022
Team ID	PNT2022TMID14251
Project Name	Natural Disaster Intensity Analysis and Classification using Artificial Intelligence

INSERTING NECESSARY LIBRARIES:

Numpy: It is an open source numerical python library. **Scikit-learn:**

It is a machine learning library for python.

OpenCV: OpenCV is a library of programming functions mainly aimed at real-time computer vision.

Flask: Web framework used for building web application.

```
In [1]: import mumpy as mpAused for numerical analysis
import tensorflow source used for both ML and DL for computation
from tensorflow source used for both ML and DL for computation
from tensorflow keras import layers MA layer consists of a tensor-in tensor-out computation function
MOmens layer is the regular density numerical neural network layer
from tensorflow keras.layers import Dense, flatten
Afactom-used for flattening the imput or thouge the disension
from tensorflow keras.layers import Conv2D, ManPooling2D @Convolutional layer
ManPooling2D-for downsompling the image
from keras.preprocessing leage import laggeDataGenerator
Using Tensorflow backend.

In [2]: tensorflow._version_

Dut[3]: '2.5.0'

In [3]: tensorflow.keras._version_

Dut[3]: '2.5.8'
```

LOADING DATA AND PERFORMING DATA AUGUMENTATION:

Loading the data into the Jupyter notebook by using RR dataset path.

```
Loading our data and performing Data Augumentation

In [5]: **substanting data measuration to train and **Combined to train an
```

CREATING THE MODEL:

Creating the Model a Classifier Sequential. Classifier is a machine learning algorithm that determines the class of the input element based on the set of the feature. In this model using convolution2D function. Convolution2D parameter is an number of filters that convolution layer will be learn from. Then we will be using MaxPooling2D function. Then, using a Flatten() function that flatten the multidimensional input denser into the denser.

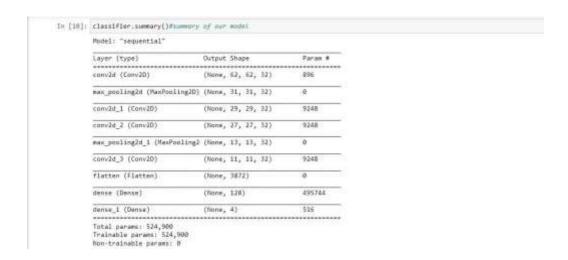

```
In [9]: # Initializing the CNW
    classifier = Sequential()

# First convolution tayer and poolings
    classifier.add(Conv20(12, (%, 3), input_shape=(64, 64, 3), activation='relu'))
    classifier.add(Conv20(32, (%, 3), input_shape=(64, 64, 3), activation='relu'))
    # Second convolution layer and pooling
    classifier.add(Conv20(32, (%, 3), input_shape=(64, 64, 3), activation='relu'))
    # input_shape is going to be the pooled feature maps from the previous convolution layer
    classifier.add(MaxPooling2D(pool_size=(2, 2)))
    classifier.add(Conv2D(32, (%, 3), input_shape=(64, 64, 3), activation='relu'))

# Flattening the layers
    classifier.add(Elatten())

# Adding a fully connected layer
    classifier.add(Dense(units=128, activation='relu'))
    classifier.add(Dense(units=128, activation='relu'))
    classifier.add(Dense(units=4, activation='softmax')) # softmax for more than 2
```

Using classifier.summary() function summary of our model

COMPILING THE MODEL:

The model is compiled using the following code.

```
In [11]: # Compiling the CAN
# coteporital_crossentrupy for more than 2
classifier.compile(optimizer='adm', loss='categorical_crossentrupy', metrics=['accuracy'])
```

FITTING THE MODEL:

Fitting the Model with 70 epoch.

```
| File | ESH | Very | Market | Cell | Kolman | Wogets | Hospin | Hospin | Cell | Warkets | Hospin | Hospin
```

SAVING THE MODEL:

Saving the Model as disaster.h5. disaster.h5 file is used to find the image classification files. Model.json represents that Jason stands for JavaScript object rotation, Jason is a lite weight data format used for data inserting between multiple different language.

PREDICTING RESULTS:

Loading model from the tensorflow keras models and loading the image then converting image into array. Then predicting our model.
